

Contest Overview

Prize Overview

We will migrate and containerize an application (of the winner's choice) to AWS using our patented process. The winner has the opportunity to containerize an application and test it in an AWS cloud development environment for a total of three months.

We will install and configure the required database and application software and migrate the application data from your current system. We provide a multi-tenant environment with up to four docker containers and the ability to integrate with one other application if required. For administration of the service, we will provide an on-demand virtual desktop and access for an application administrator.

During the three-month pilot period the application will benefit from the FuseForward Suite:

- FuseSecure will provide access to the environment.
- FuseControl will be used for migration
- FuseForward Managed Services

After the three-month test period, the winner has the opportunity to move the containerized application into their own production environment – retaining the work we conducted as part of the migration. Alternatively, they have the choice to purchase the FuseForward Suite at this time if it is necessary.

Benefits

- An opportunity to pilot your application in a container environment. This makes the application portable. For an ISV enables them to put an application on the marketplace.
- An opportunity to see how your application performs in the cloud, supported by three months' worth of infrastructure and managed services.
- Your data migrated to an AWS environment.
- An optional integration to another applications.

Prize is suitable for

- **Organization:** Aimed at ISV's developing and supporting container applications or an IT department running and operating container applications (or wanting to move applications into a container). Could be any size organization.

- **Application type:** Any app that can run in a container. Windows or Linux. Not suitable for legacy applications.
- **Development environment:** Gives you the opportunity to pilot application for three months.

Prize technical details

Migrate an application to the AWS cloud. We will provision, configure and operate a pilot container application environment for the winner. The environment will contain the following:

- Tenancy in FuseForward's multi-tenant application private cloud with a multi-tenant security service and multi-tenant database accessed via the internet.
- Four docker containers
- An extensible and scalable environment that can be easily converted into a production scale system.
- JDBC Compliant database
- The migration of your container application images for one application to the FuseForward cloud.
- An average of 1GB per day network traffic (over a month)
- Integration to one application in your current environment if required
- A service level of 48 hours for the recovery time objective and 24 hours for the recovery point objective for the pilot application environment.
- A managed service to provision, configure, operate and manage the pilot system for you.
- multi-tenant database server capacity of an average utilization of 2 vCPU and 4 GB of memory and up to 2GB of database storage for the application database.
- Ten users for the duration of pilot.

How to enter

Visit us at booth #210 at the Toronto AWS Summit on September 20.

How prize is awarded

Prize will be drawn September 26 in Vancouver, winners will be notified by email.
